$\qquad$

Find total gain, $G_{T}=v_{o} / v_{i}$, for the cascaded amplifier circuit shown below. Then reverse the order of the inverting and non-inverting amps and calculate the total gain again. The op amps are ideal.

Note: The source resistance stays with the source and the load resistance stays at the final output - they do not move when the amps are swapped.

as shown: $G_{T}=$ $\qquad$
with amps reversed: $G_{T}=$ $\qquad$
